Report-3

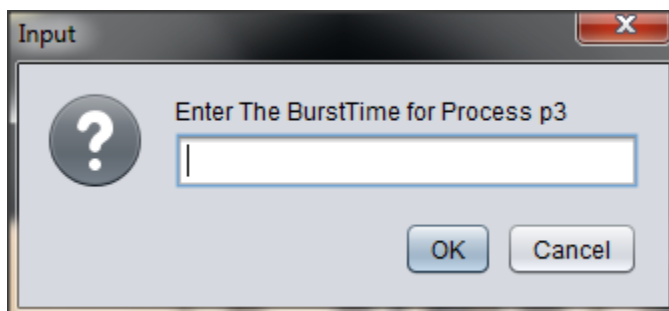

- We implemented a GUI model with java swing library.
- First we create a java frame which has the interface to the user and it has a run button.
- When user click that 'Run' button, system will ask user to enter the number of process which are going manipulate by scheduler.
- Also user will asked to enter the burst time for each process and the time slice/time quantum of the scheduler.

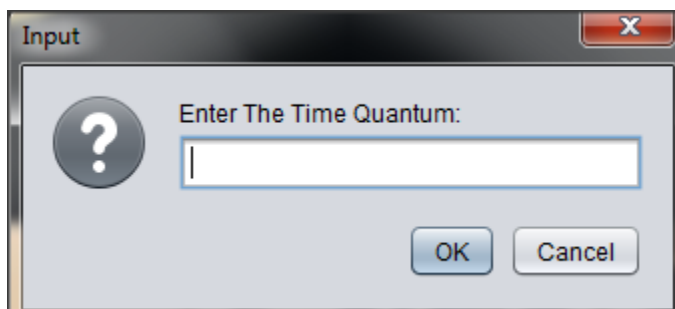

- This panel design popup to enter the number of process

- These types' panels to appear after the first panel to enter the burst time of each process.

- This one to enter the time slice of scheduler

Now our output details are shown in the terminal and it has some bugs to clear. So we are going further develop this system to show the output in that GUI model as well.
